

recoSTAR technology is designed for **high automation** and **user-friendliness**. The touch screen enables a simple start-stop procedure, RFID-chip user levels and screenshots (USB port). This ensures **highest efficiency** and consequently **fast ROI**. Features are either standard or can be added according to customer's requirements.

**Online support**  
Using a DSL connection, the online support establishes a connection from Starlinger to the recycling line at the customer – wherever in the world it is installed.

**Inline viscosimeter**  
The continuously measured IV of the PET melt during extrusion helps to control quality and indicates any required change of settings.

**Online colour measurement**  
Colour deviations from a set standard are detected and serve as an inline quality control of the input material. Deviations can be offset by adding additive (either liquid or masterbatch).

**Online writer and archiving**  
The online writer collects all relevant production data for secure traceability. Up to 50 parameters can be stored in short intervals in an internal memory and thus are saved in the event of a power cut.

We reserve the right to technical modifications. DPR-24841-08/V

### RECYCLING LINE recoSTAR PET FG/FG+

for production and post-consumer scrap, preforms, bottle and sheet flakes, integrated pre-drying, dust-free processing, energy efficient, high ROI, full automation

State-of-the-art recycling technology for the in-house recycling of PET flakes from bottles, preforms, strapping bands and sheets, as well as for the recycling of post-consumer bottle flakes after the washing process. The end product is melt-filtrated, uniform granulate that can be used for a wide range of food-contact applications.

recoSTAR FG and FG+ are cost-effective PET food-contact recycling machines with compact footprint, minimal energy consumption and moderate IV increase.

**The PET flakes** are fed into the pre-drying unit on top of the extruder. The material is dried, heated and crystallised, either by application of hot (desiccant) air, or vacuum. This treatment contributes a ready to outstanding decontamination results.

**The high-vacuum degassing extruder** reduces viscosity loss during extrusion and purifies the melt from volatile contamination. The water-free vacuum pump reduces production and maintenance costs.

**Continuous filters** for dirt particle removal are available with or without backflushing. The direct material flow reduces stress on material. Finest filtration available on request.

**The underwater pelletiser** is energy-saving, features a simple start-up procedure, and can replace the strand pelletiser or automatic strand pelletiser. Pellet size and bulk density are adjustable for all pelletising systems.

**The inline crystallisation** ensures optimised footprint, energy savings, and high crystallinity. **Online colour measurement** guarantees first-class colour values.

**Alternative energies** such as natural gas or steam can be used as a cost-friendly alternative for heating.

**Resin-like characteristics** of the rPET in terms of form, flow behaviour, crystallinity, humidity, dust content, etc. **Suitable & accepted for a wide range of food-contact applications.**

Advantages

- Food-contact decontamination
- FIFO ensures uniform treatment
- Energy-saving through inline processing
- Improved production efficiency
- User-friendly touchscreen and high automation
- Modular design provides flexibility – e.g. single-mode extruder operation for recoSTAR PET 330

Starlinger recycling technology allows utmost flexibility for the customer and adjustment to the ever changing requirements in the market or applications through modular design.

2-stage drying – hot air and dry air

recoSTAR PET FG	Food contact	FDA/EFSA	Decontamination/ VOC	Brand owner approved	Low AA level	IV increase
	✓	✓	✓		optionally	with reduced output ✓

2-stage drying – hot air and vacuum

recoSTAR PET FG+	Food contact	FDA/EFSA	Decontamination/ VOC	Brand owner approved	Low AA level	IV increase
	✓	✓	✓✓		optionally	with full output ✓✓

PET flakes are heated and dried in a two-stage process, first with hot air, then by means of dry air or vacuum. The special design of the dryer outlets results in center flow prevention, consistent residence time and FIFO processing. This ensures decontamination for food contact applications and ideal preparation for the extrusion process with IV increase. A choice of filtration and pelletising systems is available. Once installed, the unit can be equipped with an SSP reactor (IV+) to increase viscosity and decontamination levels.
